

How can children with serious illnesses receive more homebased care?

In the research project **CHIP homeTec** we want to acquire knowledge about the **needs and experiences of families** who have children with serious illness.

With a questionnaire, we will investigate the possibilities for using **health technology** to support treatment and needs, and if this to a greater extent can take place in the **child's home**.

- Are you the guardian of a child with a life-threatening or life-limiting condition?
- Do you have experience, opinions or thoughts about follow-up from home?
- Do you want to contribute to a Norwegian research project on pediatric palliative care and health technology?

Then we would appreciate if you would like to participate in our survey, it will take approx. 20 minutes.

Follow the link below or access the QR code for more information and to participate:
